BOX Game: Rules

1. The game board consists of boxes with symbols. For example:

BOX Game: Rules

1. The game board consists of boxes with symbols. For example:

2. We chose two colors, for example purple and green.
 - One color is the winning color, for example purple.
 - Then the non-winning color is green.

BOX Game: Rules

1. The game board consists of boxes with symbols. For example:

2. We chose two colors, for example purple and green.
 - One color is the winning color, for example purple.
 - Then the non-winning color is green.
3. Now we can play: assign the two colors to each symbol such that its underlined and non-underlined occurrences have a different color.

BOX Game: Rules

1. The game board consists of boxes with symbols. For example:

2. We chose two colors, for example purple and green.
 - One color is the winning color, for example purple.
 - Then the non-winning color is green.
3. Now we can play: assign the two colors to each symbol such that its underlined and non-underlined occurrences have a different color.
4. If each box contains a symbol in purple you won.

Some Examples

- Wrong coloring!

Some Examples

- Wrong coloring!

- Again a wrong coloring!

Some Examples

- Wrong coloring!

- Again a wrong coloring!

- Lost!

Some Examples

- Wrong coloring!

- Again a wrong coloring!

- Lost!

- Won!

Some Terminology

- From now on, we call a box a **clause**.
- We call a clause with at least one purple symbol **satisfied**.
- We call a clause with all symbols in green **falsified**.
- We call a clause with green and uncolored symbols **undecided**.

⇒ The game is won if all clauses are satisfied.

Guess & Check Problems

observation in our BOX game:

- finding a solution is hard
 - 2^n solution candidates have to be considered
 - a good oracle is needed for guessing
- verifying a given candidate solution is easy
 - check that each box contains a purple symbol

Guess & Check Problems

observation in our BOX game:

- finding a solution is hard
 - 2^n solution candidates have to be considered
 - a good oracle is needed for guessing
- verifying a given candidate solution is easy
 - check that each box contains a purple symbol

fundamental question in computer science:

The P = NP Question

Is searching for a solution harder than verifying a solution?

(unfortunately, the answer is not known)

Famous Guess & Check Problem: SAT

SAT is the decision problem of propositional logic:

- Given a Boolean formula, for example

$$(\neg x \vee \neg y) \wedge (x \vee \neg y) \wedge (\neg x \vee z) \wedge (y \vee \neg z).$$

- Question: is the formula satisfiable?

I.e., is there an assignment of truth values **1 (true)**, **0 (false)** to the literals $x, y, z, \neg x, \neg y, \neg z$ such that

- for every variable $v \in \{x, y, z\}$ it holds that the truth value of v and the truth value of $\neg v$ are different
- each clause (...) contains at least one true literal

Famous Guess & Check Problem: SAT

SAT is the decision problem of propositional logic:

- Given a Boolean formula, for example

$$(\neg x \vee \neg y) \wedge (x \vee \neg y) \wedge (\neg x \vee z) \wedge (y \vee \neg z).$$

- Question: is the formula satisfiable?

I.e., is there an assignment of truth values **1 (true)**, **0 (false)** to the literals $x, y, z, \neg x, \neg y, \neg z$ such that

- for every variable $v \in \{x, y, z\}$ it holds that the truth value of v and the truth value of $\neg v$ are different
- each clause (...) contains at least one true literal

Cook-Levin Theorem [71]: SAT is NP-complete

Searching is as easy as checking if and only if it is for SAT.

Relating BOX and SAT

There is a correspondence between BOX and SAT, e.g., between

and $(\neg x \vee \neg y) \wedge (x \vee \neg y) \wedge (\neg x \vee z) \wedge (y \vee \neg z)$:

Relating BOX and SAT

There is a correspondence between BOX and SAT, e.g., between

and $(\neg x \vee \neg y) \wedge (x \vee \neg y) \wedge (\neg x \vee z) \wedge (y \vee \neg z)$:

- x corresponds to ♥, $\neg x$ corresponds to ♥
- y corresponds to ◇, $\neg y$ corresponds to ◇
- z corresponds to □, $\neg z$ corresponds to □
- purple/green coloring corresponds to assignment of literals to true/false (1/0)

Relating BOX and SAT

There is a correspondence between BOX and SAT, e.g., between

and $(\neg x \vee \neg y) \wedge (x \vee \neg y) \wedge (\neg x \vee z) \wedge (y \vee \neg z)$:

- x corresponds to \heartsuit , $\neg x$ corresponds to \heartsuit
- y corresponds to \diamond , $\neg y$ corresponds to \diamond
- z corresponds to \square , $\neg z$ corresponds to \square
- purple/green coloring corresponds to assignment of literals to true/false (1/0)

Note:

Relating BOX and SAT

There is a correspondence between BOX and SAT, e.g., between

and $(\neg x \vee \neg y) \wedge (x \vee \neg y) \wedge (\neg x \vee z) \wedge (y \vee \neg z)$:

- x corresponds to \heartsuit , $\neg x$ corresponds to \heartsuit
- y corresponds to \diamond , $\neg y$ corresponds to $\underline{\diamond}$
- z corresponds to \square , $\neg z$ corresponds to $\underline{\square}$
- purple/green coloring corresponds to assignment of literals to true/false (1/0)

Note:

- assignment of variables gives values of all literals
- if we can solve SAT, we can solve BOX (and vice versa)

Logics in this Lecture

In this lecture, we consider different logic-based languages:

- propositional logic (SAT)
 - simple language: only atoms and connectives
 - low expressiveness, low complexity
 - very successful in industry (e.g., verification)
- first-order logic (predicate logic)
 - rich language: predicates, functions, terms, quantifiers
 - great power of expressiveness, high complexity
 - many applications in mathematics and verification
- satisfiability modulo theories (SMT)
 - customizable language: user decides
 - as much expressiveness as required
as much complexity as necessary
 - very popular and successful in industry

Logic-Based Languages (Logics)

- A logic consists of
 - a set of symbols (like $\vee, \wedge, \neg, \top, \perp, \forall, \exists \dots$)
 - a set of variables (like x, y, z, \dots)
 - concise syntax: well-formedness of expressions
 - concise semantics: meaning of expressions
- Logics support reasoning for
 - derivation of “new” knowledge
 - proving the truth/falsity of a statement (satisfiability checking)
- Different logics differ in their
 - truth values: binary (true, false), multi-valued (true, false, unknown), fuzzy (between 0 and 1, e.g., $[0, 1]$ as subset of the real numbers)
 - expressiveness (what can be formulated in the logic?)
 - complexity (how expensive is reasoning?)

PROPOSITIONAL LOGIC

Propositions

a proposition is an atomic statement that is either true or false

example:

- Alice comes to the party.
- It rains.

with connectives, propositions can be combined

example:

- Alice comes to the party, Bob as well, but not Cecile.
- If it rains, the street is wet.

Propositional Logic

- two truth values (Boolean domain): true/false, verum/falsum, on/off, 1/0
- language elements
 - atomic propositions (atoms, variables)
 - no internal structure
 - either true or false
 - logic connectives: not (\neg), and (\wedge), or (\vee), ...
 - operators for construction of composite propositions
 - concise meaning
 - argument(s) and return value from Boolean domain
 - parenthesis

example: formula of propositional logic: $(\neg t \vee s) \wedge (t \vee s) \wedge (\neg t \vee \neg s)$

atoms: **t**, **s**, connectives: \neg , \vee , \wedge , parenthesis for structuring the expression

Background

- historical origins: ancient Greeks
- in philosophy, mathematics, and computer science
- two very basic principles:
 - Law of Excluded Middle:
a proposition is true or its negation is true
 - Law of Contradiction:
no expression is both true and false at the same time
- very simple language
 - no objects, no arguments to propositions
 - no functions, no quantifiers
- solving is easy (relative to other logics)
- many applications in industry

Syntax: Structure of Propositional Formulas

we build a propositional formula using the following components:

- literals:

- variables x, y, z, \dots
- negated variables $\neg x, \neg y, \neg z, \dots$
- truth constants: \top (verum) and \perp (falsum)
- negated truth constants: $\neg\top$ and $\neg\perp$

- clauses: disjunction (\vee) of literals

- $x \vee y$
- $x \vee y \vee \neg z$
- z
- \top

Syntax: Structure of Propositional Formulas

A propositional formula is a conjunction (\wedge) of clauses.

examples of formulas:

- \top
- \perp
- x
- $\neg y$
- $x \wedge y \wedge z$
- $(\neg x \vee y \vee \neg z) \wedge z$
- $(x \vee \neg y) \wedge (x \vee \neg y \vee z) \wedge (y \vee \neg z)$
- $((l_{11} \vee \dots \vee l_{1m_1}) \wedge \dots \wedge (l_{n1} \vee \dots \vee l_{nm_n}))$

Remark: For the moment, we consider formulas of a restricted structure called CNF, e.g., we do not consider formulas like $(x \wedge y) \vee (\neg x \wedge z)$. Any propositional formula can be translated into this structure. We will relax this restriction later.

Conventions

we use the following conventions unless stated otherwise:

- a, b, c, x, y, z denote variables and l, k denote literals
- ϕ, ψ, γ denote arbitrary formulas
- C, D denote clauses
- clauses are also written as sets
 - $(l_1 \vee \dots \vee l_n) = \{l_1, \dots, l_n\}$
 - to add a literal l to clause C , we write $C \cup \{l\}$
 - to remove a literal l from clause C , we write $C \setminus \{l\}$
- formulas in CNF are also written as sets of sets
 - $((l_{11} \vee \dots \vee l_{1m_1}) \wedge \dots \wedge (l_{n1} \vee \dots \vee l_{nm_n})) =$
 $\{\{l_{11}, \dots, l_{1m_1}\}, \dots, \{l_{n1}, \dots, l_{nm_n}\}\}$
 - to add a clause C to CNF ϕ , we write $\phi \cup \{C\}$
 - to remove a clause C from CNF ϕ , we write $\phi \setminus \{C\}$

Negation

- unary connective \neg (operator with exactly one argument)
- negating the truth value of its argument
- alternative notation: $!x, \bar{x}, -x, NOT x$

truth table:

x	$\neg x$
0	1
1	0

example:

- If the atom "It rains." is true then the negation "It does not rain." is false.
- If the propositional variable a is true then $\neg a$ is false.
- If the propositional variable a is false then $\neg a$ is true.

Disjunction

- a disjunction is true iff at least one of the arguments is true
- alternative notation for $l \vee k$: $l \parallel k, l + k, l \text{ OR } k$
- For $(l_1 \vee \dots \vee l_n)$ we also write $\bigvee_{i=1}^n l_i$.

truth table:

l	k	$l \vee k$
0	0	0
0	1	1
1	0	1
1	1	1

example:

- $(a \vee \neg a)$ is always true.
- $(\top \vee a)$ is always true.
- $(\perp \vee a)$ is true if a is true.

Conjunction

- a conjunction is true iff both arguments are true
- alternative notation for $C \wedge D$: $C \&\& D$,
 $CD, C * D, C \cdot D, C \text{ AND } D$
- for $(C_1 \wedge \dots \wedge C_n)$ we also write $\bigwedge_{i=1}^n C_i$.

truth table:

C	D	$C \wedge D$
0	0	0
0	1	0
1	0	0
1	1	1

example:

- $(a \wedge \neg a)$ is always false.
- $(\top \wedge a)$ is true if a is true. $(\perp \wedge \phi)$ is always false.

Properties of Connectives

■ rules of precedence:

- \neg binds stronger than \wedge
- \wedge binds stronger than \vee

example

- $\neg a \vee b \wedge \neg c \vee d$ is the same as $(\neg a) \vee (b \wedge (\neg c)) \vee d$, but not $((\neg a) \vee b) \wedge ((\neg c) \vee d)$

⇒ put clauses into parentheses!

■ associativity:

- \wedge is associative and commutative
- \vee is associative and commutative

example

- $(a \wedge b) \wedge \neg c$ is the same as $a \wedge (b \wedge \neg c)$
- $(a \vee b) \vee \neg c$ is the same as $a \vee (b \vee \neg c)$

Assignment

- a variable can be assigned one of two values from the two-valued domain \mathbb{B} , where $\mathbb{B} = \{\mathbf{1}, \mathbf{0}\}$
- the mapping $\nu : \mathcal{P} \rightarrow \mathbb{B}$ is called assignment, where \mathcal{P} is the set of atomic propositions
- we sometimes write an assignment ν as set V with $V \subseteq \mathcal{P} \cup \{\neg x \mid x \in \mathcal{P}\}$ such that
 - $x \in V$ iff $\nu(x) = \mathbf{1}$
 - $\neg x \in V$ iff $\nu(x) = \mathbf{0}$
- for n variables, there are 2^n assignments possible
- an assignment corresponds to one line in the truth table

Assignment: Example

x	y	z	$x \vee y$	$\neg z$	$(x \vee y) \wedge \neg z$
0	0	0	0	1	0
0	0	1	0	0	0
0	1	0	1	1	1
0	1	1	1	0	0
1	0	0	1	1	1
1	0	1	1	0	0
1	1	0	1	1	1
1	1	1	1	0	0

- one assignment: $v(x) = 1, v(y) = 0, v(z) = 1$
- alternative notation: $V = \{x, \neg y, z\}$
- observation: A variable assignment determines the truth value of the formulas containing these variables.

Semantics of Propositional Logic

Let \mathcal{P} be the set of atomic propositions (variables) and \mathcal{L} be the set of all propositional formulas over \mathcal{P} that are syntactically correct (i.e., all possible conjunctions of clauses over \mathcal{P}).

Given assignment $\nu : \mathcal{P} \rightarrow \mathbb{B}$, the interpretation $[\cdot]_{\nu} : \mathcal{L} \rightarrow \mathbb{B}$ is defined by:

- $[\top]_{\nu} = \mathbf{1}$, $[\perp]_{\nu} = \mathbf{0}$
- if $x \in \mathcal{P}$ then $[x]_{\nu} = \nu(x)$
- $[\neg x]_{\nu} = \mathbf{1}$ iff $[x]_{\nu} = \mathbf{0}$
- $[C]_{\nu} = \mathbf{1}$ (where C is a clause) iff
there is at least one literal l with $l \in C$ and $[l]_{\nu} = \mathbf{1}$
- $[\phi]_{\nu} = \mathbf{1}$ (where ϕ is in CNF) iff
for all clauses $C \in \phi$ it holds that $[C]_{\nu} = \mathbf{1}$

Satisfying/Falsifying Assignments

- an assignment ν is called
 - satisfying a formula ϕ iff $[\phi]_{\nu} = \mathbf{1}$
 - falsifying a formula ϕ iff $[\phi]_{\nu} = \mathbf{0}$
- a satisfying assignment for ϕ is a model of ϕ
- a falsifying assignment for ϕ is a counter-model of ϕ

example:

For formula $((x \vee y) \wedge \neg z)$,

- $\{x, y, z\}$ is a counter-model,
- $\{x, y, \neg z\}$ is a model.

SAT-Solver Limboole

- available at <http://fmv.jku.at/limboole>
- input:¹
 - variables are strings over letters, digits and `-_ . [] $ @`
 - negation symbol \neg is `!`
 - disjunction symbol \vee is `|`
 - conjunction symbol \wedge is `&`

example

$(a \vee b \vee \neg c) \wedge (\neg a \vee b) \wedge c$ is represented as

`(a | b | !c) & (!a | b) & c`

¹For now, we will only use subset of the language supported by Limboole.

Properties of Propositional Formulas (1/2)

- formula ϕ is satisfiable iff
there exists an assignment ν with $[\phi]_{\nu} = \mathbf{1}$
check with `limboole -s`
- formula ϕ is valid iff
for all assignments ν it holds that $[\phi]_{\nu} = \mathbf{1}$
check with `limboole`
- formula ϕ is refutable iff
there exists an assignment ν with $[\phi]_{\nu} = \mathbf{0}$
check with `limboole`
- formula ϕ is unsatisfiable iff
for all assignments ν it holds that $[\phi]_{\nu} = \mathbf{0}$
check with `limboole -s`

Properties of Propositional Formulas (2/2)

- a valid formula is called tautology
- an unsatisfiable formula is called contradiction

example:

- \top is valid.
- $a \vee \neg a$ is a tautology.
- $(a \vee \neg b) \wedge (\neg a \vee b)$ is refutable.
- \perp is unsatisfiable.
- $a \wedge \neg a$ is a contradiction.
- $(a \vee \neg b) \wedge (\neg a \vee b)$ is satisfiable.

SAT: The Boolean Satisfiability Problem

Given a propositional formula ϕ .
Is there an assignment that satisfies ϕ ?

different formulation: can we find an assignment such that each clause contains at least one true literal?

Encoding the k-Coloring Problem

Given graph (V, E) with vertices V and edges E . Color each node with one of k colors, such that there is no edge $(v, w) \in E$, with vertices v and w colored in the same color.

encoding:

1. propositional variables: v_j ... node $v \in V$ has color j ($1 \leq j \leq k$)

2. each node has a color:

$$\bigwedge_{v \in V} \left(\bigvee_{1 \leq j \leq k} v_j \right)$$

3. each node has just one color: $(\neg v_i \vee \neg v_j)$ with $v \in V, 1 \leq i < j \leq k$

4. neighbors have different colors: $(\neg v_i \vee \neg w_i)$ with $(v, w) \in E, 1 \leq i \leq k$

Encoding the k-Coloring Problem: Example

task: find 2-coloring of graph $(\{a, b, c\}, \{(a, b), (b, c)\})$ with SAT

possible solution:

encoding in SAT:

Encoding the k-Coloring Problem: Example

task: find 2-coloring of graph $(\{a, b, c\}, \{(a, b), (b, c)\})$ with SAT
possible solution:

encoding in SAT:

- variables: $a_1, a_2, b_1, b_2, c_1, c_2$

Encoding the k-Coloring Problem: Example

task: find 2-coloring of graph $(\{a, b, c\}, \{(a, b), (b, c)\})$ with SAT
possible solution:

encoding in SAT:

- variables: $a_1, a_2, b_1, b_2, c_1, c_2$
- clauses:
 1. each node has a color: $(a_1 \vee a_2), (b_1 \vee b_2), (c_1 \vee c_2)$
 2. no node has two colors: $(\neg a_1 \vee \neg a_2), (\neg b_1 \vee \neg b_2), (\neg c_1 \vee \neg c_2)$
 3. connected nodes have a different color:
 $(\neg a_1 \vee \neg b_1), (\neg a_2 \vee \neg b_2), (\neg b_1 \vee \neg c_1), (\neg b_2 \vee \neg c_2)$

Encoding the k-Coloring Problem: Example

task: find 2-coloring of graph $(\{a, b, c\}, \{(a, b), (b, c)\})$ with SAT
possible solution:

encoding in SAT:

- variables: $a_1, a_2, b_1, b_2, c_1, c_2$
- clauses:
 1. each node has a color: $(a_1 \vee a_2), (b_1 \vee b_2), (c_1 \vee c_2)$
 2. no node has two colors: $(\neg a_1 \vee \neg a_2), (\neg b_1 \vee \neg b_2), (\neg c_1 \vee \neg c_2)$
 3. connected nodes have a different color:
 $(\neg a_1 \vee \neg b_1), (\neg a_2 \vee \neg b_2), (\neg b_1 \vee \neg c_1), (\neg b_2 \vee \neg c_2)$
- full formula:
 $(a_1 \vee a_2) \wedge (b_1 \vee b_2) \wedge (c_1 \vee c_2) \wedge (\neg a_1 \vee \neg a_2) \wedge (\neg b_1 \vee \neg b_2) \wedge (\neg c_1 \vee \neg c_2) \wedge$
 $(\neg a_1 \vee \neg b_1) \wedge (\neg a_2 \vee \neg b_2) \wedge (\neg b_1 \vee \neg c_1) \wedge (\neg b_2 \vee \neg c_2)$

Resolution

- the resolution calculus consists of the single resolution rule

$$\frac{x \vee C \quad \neg x \vee D}{C \vee D}$$

- C and D are (possibly empty) clauses
 - the clause $C \vee D$ is called resolvent
 - variable x is called pivot
 - antecedent clauses $x \vee C$ and $\neg x \vee D$ are NOT tautological
- the resolution calculus works only on formulas in CNF
- if the empty clause can be derived then the formula is unsatisfiable
- if the formula is unsatisfiable, then the empty clause can be derived

Examples of Applying the Resolution Rule

one application of resolution

$$\frac{x \vee y \vee \neg z \quad \neg x \vee y' \vee \neg z}{y \vee \neg z \vee y'}$$

derivation of empty clause:

$$\frac{y \quad \neg y}{\perp}$$

derivation of tautology:

$$\frac{x \vee a \quad \neg x \vee \neg a}{a \vee \neg a}$$

incorrect application of the resolution rule:

$$\frac{x \vee a \vee \neg x \quad \neg x \vee \neg a}{????}$$

Resolution Example

We prove unsatisfiability of

$\{(\neg x_1 \vee \neg x_5), (x_4 \vee x_5), (x_2 \vee \neg x_4), (x_3 \vee \neg x_4), (\neg x_2 \vee \neg x_3), (x_1 \vee x_4 \vee \neg x_6), (x_6)\}$

as follows:
